

Introduction to NeTEx profiles

17th of June 2021

Data4PT has received funding from the European Union's DG for Mobility and Transport under grant agreement No MOVE/B4/SUB/2019-104/CEF/PSA/SI2.821136

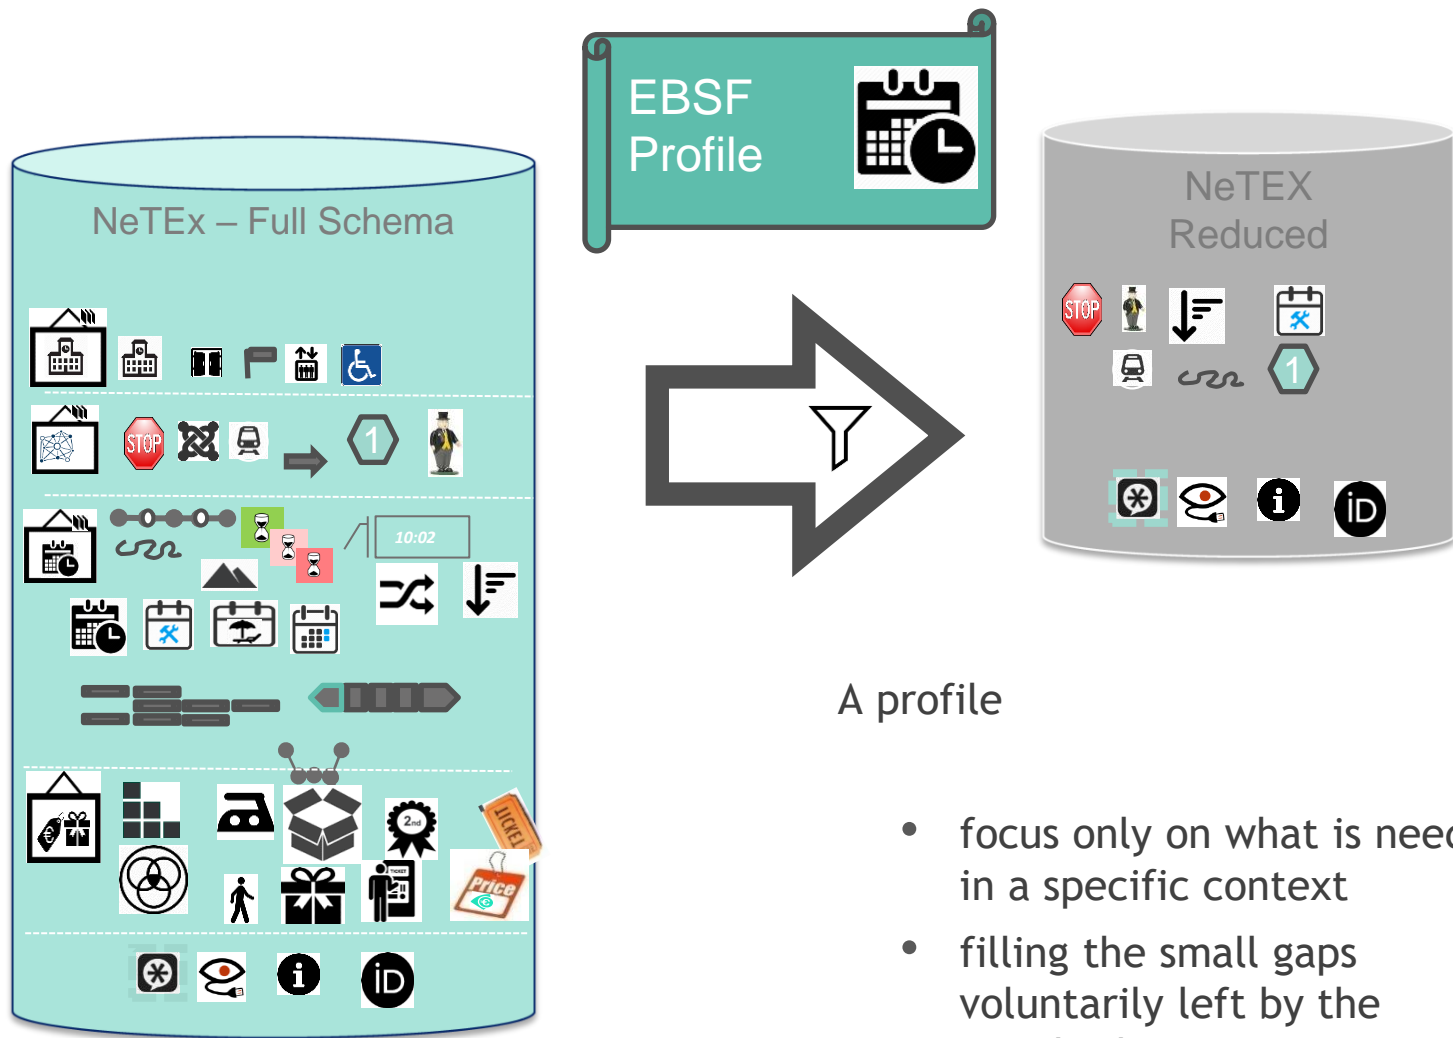

Profiles - reminder

A profile

- focus only on what is needed in a specific context
- filling the small gaps voluntarily left by the standard

Profiles - reminder

A profile

- focus only on what is needed in a specific context
- filling the small gaps voluntarily left by the standard

NeTEx and SIRI profiles

- NeTEx is for planned data
- SIRI is for real time data

SIRI

NeTEx profiles – two examples

- Profile used in EBSF2 project
- Norwegian (Nordic) profile

EBSF2 NeTEx Profile

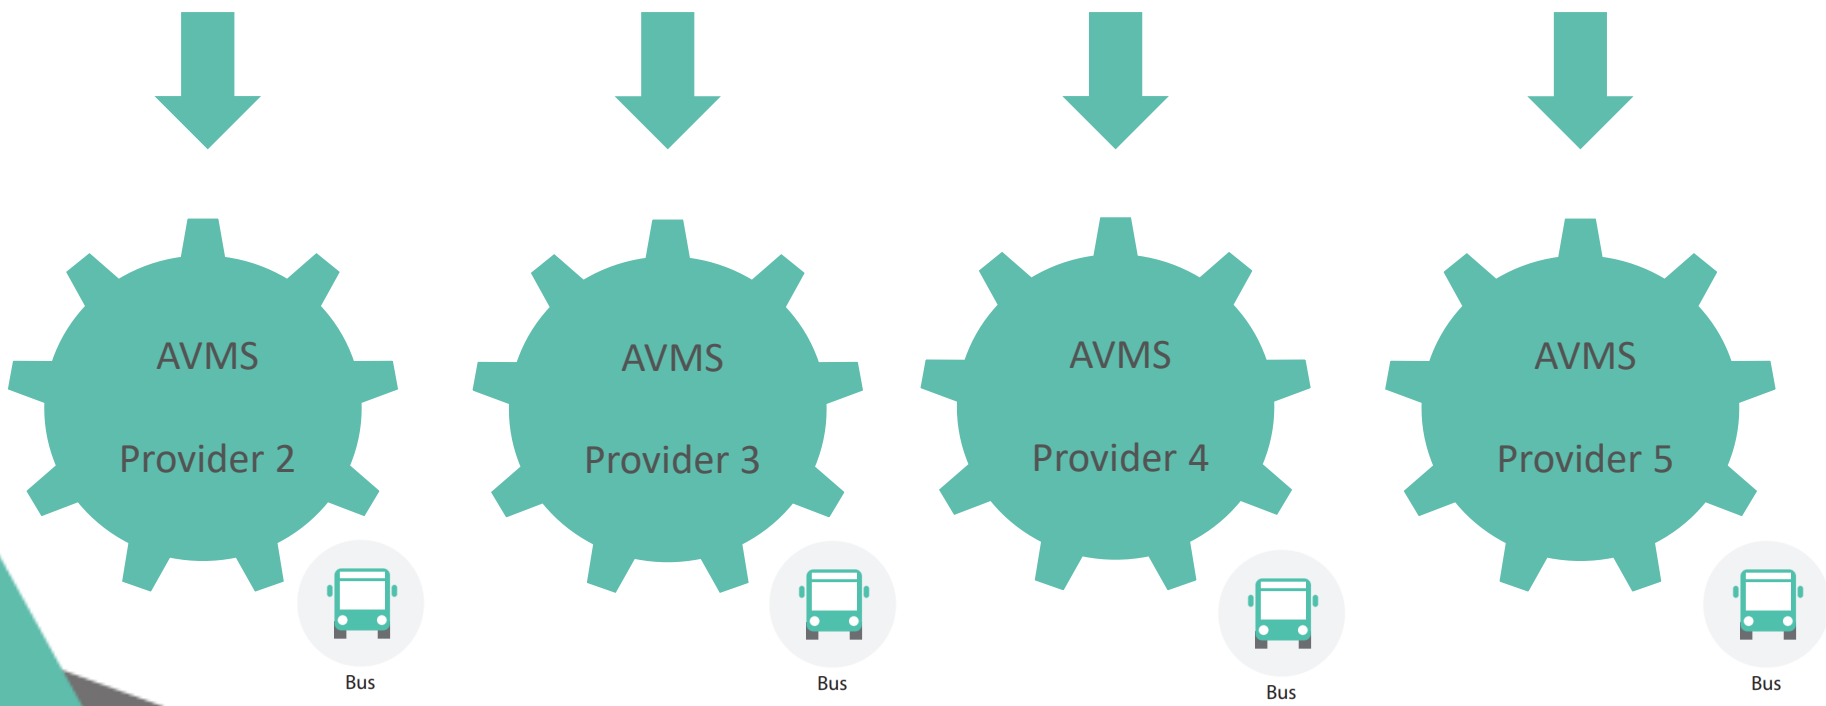

- Field test at Transport for London
- Developed as part of the European Bus System of the Future 2 project in cooperation with partners from different countries.
- Operational data (Blocks and Dead Runs) in addition to Timetables and Calendars

Different AVMS - suppliers needs data

Planned data:
Network
Timetables
Vehicle Schedules

Field test – planned data available at TfL

Bespoke

		(This element will always be included in EBSF2 profile 2 deliveries.)
<ul style="list-style-type: none"> <u>TimeDemandTypeRef</u> 	1:1	<p>A reference to the applied TIME DEMAND TYPE for this DEAD RUN</p> <p>A TIME DEMAND TYPE is an indicator of traffic conditions or other factors that may affect vehicle run or wait times.</p> <p>The contained ref-attribute represents a synthetic TIME DEMAND TYPE based on analyzing and enumerating the different timings used for complete JOURNEY PATTERNS.</p> <p><u>Eg. TT_118</u></p> <p>Note that the TIME DEMAND TYPE enumerations are not synchronized across different JOURNEY PATTERNS.</p>
<p>Calls</p>	1:1	Ordered collection of the CALLs included in this SERVICE JOURNEY.
<ul style="list-style-type: none"> Call 	2:m	<p>A CALL provides assembled data related to the visit to a POINT IN JOURNEY PATTERN, such as Arrival and Departure times, in an un-ambiguous manner without having to analyze TIME DEMAND TYPEs or combine run and wait times.</p> <p>See details below.</p>

3.5.2.3 Calls (in SERVICE JOURNEY)

Container for the ordered collection of CALLs included in a SERVICE JOURNEY.

Elements		Description
<u>ScheduledStopPointRef</u>	1:1	<p>Reference to the POINT IN JOURNEY PATTERN that this CALL applies to.</p> <p>For POINTs IN JOURNEY PATTERN that are listed as SCHEDULED STOP POINTs the contained Ref-attribute has the same value as the Id of the associated SCHEDULED STOP POINT in the SITE FRAME and is on the form <u>lbsl:stopPointIdx:[Stop_Point_Idx]</u></p> <p><u>Eg. lbsl:stopPointIdx:3215</u></p>

EBSF 2 NeTEx Profile

- One xml-file per Line with Service Journeys and related info
- One xml-file per operator and depot with operational data such as Blocks and DeadRuns
- Shared file for geo - StopPlaces, Quays etcetera

Name	Date modified	Type	Size

Norwegian (Nordic) Profile

Norwegian (Nordic) Profile

– extensive, easy to understand documentation with relevant examples and descriptions

Håndbok N801 (SIRI/NeTEx) / ... / stops

Quay

i A part of **StopPlace** where passengers can board or disembark a vehicle. For example tactile paving position at a bus stop, the midpoint of a railway platform, a gate at an airport.

See definition under General information.

Examples in the [GitHub-repository](#).

Please note:

- Quays do **not** have their own names. This information is inherited from the parent **StopPlace**.
- **QuayType** is **not** to be specified. This information is inherited from **TransportMode** on the parent **StopPlace**. The Norwegian NeTEx profile does not allow "multimodal" Quays.

Quay < StopPlaceSpace < SiteElement < AddressablePlace < Place < Zone < GroupOfPoints < GroupOfEntities < DataManagedObject			
Name	Type	Cardinality	Description
PrivateCode	xsd:normalizedString	0: 1	Internal code or information not to be presented to the public.
PublicCode	xsd:normalizedString	0: 1	A public code for a Quay, usually linked to a physical sign with a letter or number for the platform/track.
(attr) modification	xs:ModificationEnumeration	0: 1	Type of change (audit action). For example, <code>delete</code> when deleting a Quay.
CompassBearing	AbsoluteBearingType	0: 1	The compass bearing (direction) of the Quay, i.e. which direction will vehicles leaving the Quay travel. Set in degrees.

NeTEx in Norway – multiple file concept

- One xml-file per Line (referring to external data in regional xml-file)
- One xml-file with shared data for a region (referring to external data in national file(s))
- National xml-file(s) for Stop Places, Quays etcetera

Many different profiles

- Some are easy to produce
- Some are compact
- Then there are also different redundant constructions that can be used...

Comparing NeTEx profiles...

- EBSF2-project Profile
 - Call-based
 - Expanded = Denormalized
 - Includes also (redundant) normalised information in parallel
 - Consistent with SIRI –profile for EBSF2
- German Profile
 - Link-RunTime/Stop-WaitTime - based
 - Compact – high degree of normalization
 - Timeband-dependant
- Norwegian/Nordic Profile
 - PassingTime based
 - Expanded but at the same time partly dependant on normalised information
- European Passenger Information Profile (EPIP)
 - PassingTime based
 - Expanded but at the same time partly dependant on normalised information
 - Reduced

NeTEx part 4: Passenger Information European Profile

CEN/TS 16614-4

= EPIP

ICS 35.240.60

English Version

Public transport - Network and Timetable Exchange (NeTEx) - Part 4: Passenger Information European Profile

Transport public - Échange des données réseau et horaires (NeTEx) - Partie 4 : Profil Européen pour l'Information Voyageur

Öffentlicher Verkehr - Netzwerk- und Fahrplanaustausch (NeTEx) - Teil 4: Europäisches Profil für Reisenden Informationen

This Technical Specification (CEN/TS) was approved by CEN on 2 March 2020 for provisional application.

The period of validity of this CEN/TS is limited initially to three years. After two years the members of CEN will be requested to submit their comments, particularly on the question whether the CEN/TS can be converted into a European Standard.

CEN members are required to announce the existence of this CEN/TS in the same way as for an EN and to make the CEN/TS available promptly at national level in an appropriate form. It is permissible to keep conflicting national standards in force (in parallel to the CEN/TS) until the final decision about the possible conversion of the CEN/TS into an EN is reached.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

EUROPEAN COMMITTEE FOR STANDARDIZATION
COMITÉ EUROPÉEN DE NORMALISATION

CEN-CENELEC Management Centre: Rue de la Science 23, B-1040 Brussels

© 2020 CEN All rights of exploitation in any form and by any means reserved worldwide for CEN national Members. Ref. No. CEN/TS 16614-4:2020 E

Additional Data4PT contribution: EPIP XSD that is adapted to the TS

- Elements and attributes removed and set as mandatory according to CEN/TS 16614-4:2020

Name	Date modified	Type	Size
 _content_NeTEx_EPIP.xsd	2021-01-15 11:18	W3C XML Schema	464 KB
 gml_combo_v3_2_1_simplified.xsd	2021-01-15 11:17	W3C XML Schema	16 KB
 NeTEx_publication_EPIP.xsd	2021-01-15 13:04	W3C XML Schema	423 KB
 NeTEx_publication_EPIP-NoConstraint.xsd	2021-01-15 13:04	W3C XML Schema	6 KB

- EPIP represented using 4 XSD-files
- Full NeTEx consists of 379 XSD-files

Some ideas...

- Use stable unique identifiers – that are shared between SIRI and NeTEx profiles
 - Look to EPIP or Norwegian profile for inspiration.
 - Suggestion: Consider using EPIP identifier convention
- Consider if several different profiles are relevant in parallel for different purposes
